

VULNERABILITY SCANNING

You check to see if you've locked your doors and windows when you leave your home. Do the same for your business.

Hackers are constantly scanning the Internet for security flaws they can take advantage of. When they find that flaw, and exploit it, your defenses are breached. This is one of the ways they steal data, infect your systems with ransomware or viruses, and create a platform to launch attacks.

Vulnerability scanning helps discover the flaws before the hackers do.

Regular vulnerability scanning is a requirement for many security frameworks, including PCI-DSS, SOC2, ISO 27001 and the NIST Cyber-Security Framework.

Simple Security use enterprise-grade vulnerability scanning software to check for more than 80,000 potential exploits and provide you with clear steps on how to solve them.

We don't just check your windows and doors – we check the welcome mat too. Your website is that welcome mat – it's the first thing a prospective client sees.

According to Symantec, more than 55% of websites have a critical vulnerability that could be exploited. What if a hacker finds a flaw in your site and steals data or installs malware? What would that do to your reputation?

We perform:

- External vulnerability scans
- Website vulnerability scans
- Internal vulnerability scans

Every scan includes:

- A simple, prioritized, dashboard-based report
- A review call with one of our security professionals
- Rescans to ensure vulnerabilities are resolved

Be sure you're protected.
